

Chat/Prompt history

NAME: Rachith M

SRN: PES2UG24CS392

SECTION: G

PROMPT_1:

"Provide me a complete step-by-step roadmap outlining pre-video recording, code updates for Tasks 1–4, testing steps, and submission guidelines. "

PROMPT_2:

"I am working on a Pygame game. Here is how collision and player movement work in [paste relevant lines/files]. Please help me implement a Trap tile/entity. When the player steps on a trap tile, reset their position back to start_pos and display a clear status message like 'Trapped! Sent back to start' on the screen. Show me the minimal necessary edits."

PROMPT_3:

"Add an Enemy Guard class/entity that patrols back and forth horizontally/vertically between two coordinates. In the main update loop, update the guard's position each frame, check for collision with the player, and reset the player's position if a collision occurs."

PROMPT_4:

"Add a mini-map rendered in the top-right corner of the screen. It should iterate over the dungeon grid, rendering distinct small colored pixels/rectangles for walls vs. floor tiles, and render a bright dot for the player's real-time coordinates."

PROMPT_5:

"Add a HUD inventory slot at the bottom-left of the screen. Draw an empty slot box initially. When player.has_key becomes True, render a key icon or symbol inside the slot."
